"Quality and Service Since 1932"

Volume 4

What is debris on the Aerator Shaft?

The technician has performed the regular maintenance on your septic system and has noted "debris on the shaft". What kind of debris is it and how do I prevent it?

Debris on the aerator shaft comes from material that enters the system that cannot be broken down by the bacteria in the system and is not caught in the trash trap.

Examples of such debris are:

Feminine hygiene products, male contraception products, dental floss, hair and any type of wipe (even the so called flushable ones). Those are not the only sources but are the most frequent.

One way to prevent debris from entering the system is adding a lint trap to the laundry. These can be installed on the washing machine discharge hose. A knee high panty hose tied to the discharge is just one style and many more can be found on the internet or your local hardware store.

Another method of prevention is to add a mesh sink strainer to your bath or shower stall. This will catch human hair and prevent it from entering the system. Be sure to throw the hair in the trash and not into the toilet.

Why Choose **MACK INDUSTRIES**?

- Locally Owned and Operated.
- Experienced Technicians.
- Provide maintenance and repairs, not just inspections.
- Over 50 years of experience installing and designing Sewage Treatment Systems.
- Norweco and Jet Distributors.

Remember,

only toilet paper should go into the toilet!

Remember, Prevention is the best form of defense!
