The New Normal and Your Wastewater System

How has the New Normal impact your Wastewater System?

Gallup Polls show that 50% of Americans are or have been working from home. Most students have been home this past year.

The more people at home means more water used. Your tanks are not used to the higher volume of water that you are now putting into your system. Some common problems that are occurring are that you may have had more service calls than you have had before or that you may have to get your system pumped more frequently. What this means to older systems, is that they may come due for replacement sooner than expected.

Why Choose **MACK INDUSTRIES**?

- Locally Owned and Operated.
- Experienced Technicians.
- Provide maintenance and repairs, not just inspections.
- Over 50 years of experience installing and designing Sewage Treatment Systems.
- Norweco and Jet Distributors.

How to improve the stress on your system:

- Make sure that you are spacing out the water usage throughout the day and the week. Your system needs a full 24 hours to process the water that you put in everyday.
- Do not use harsh chemicals when cleaning. This will also kill the bacteria in your system.
- Use bar soaps instead of liquid soaps.
- Limit the use of your garbage disposal and avoid flushing chemicals or medicine down the toilet.
- Monitor your sludge level in your tank. When inconsistent water usage happens it can push the solids and sludge into areas that may cause clogs and backups.
- Check your drain field to make sure that it is not becoming soggy and is able to handle the drainage .

Remember, Prevention is the best form of defense!
